```
Assignment no. 04
         Aim-
         1. Linear Regression : Univariate and Multivariate
         2. Least Square Method for Linear Regression
         3. Measuring Performance of Linear Regression
         4. Example of Linear Regression
         5. Training data set and Testing data set

         ne\n\nThis dataset was obtained from the StatLib repository.\nhttps://www.
         dcc.fc.up.pt/~ltorgo/Regression/cal_housing.html\n\nThe target variable is
         the median house value for California districts,\nexpressed in hundreds of
         thousands of dollars ($100,000).\n\nThis dataset was derived from the 1990
         U.S. census, using one row per census\nblock group. A block group is the s
         mallest geographical unit for which the U.S.\nCensus Bureau publishes samp
         le data (a block group typically has a population\nof 600 to 3,000 peopl
         e).\n\nA household is a group of people residing within a home. Since the
         average\nnumber of rooms and bedrooms in this dataset are provided per hou
         sehold, these\ncolumns may take surprisingly large values for block groups
         with few households\nand many empty houses, such as vacation resorts.\n\nI
         t can be downloaded/loaded using the\n:func:`sklearn.datasets.fetch califo
         rnia_housing` function.\n\n.. topic:: References\n\n
